FileZilla Instructions

When configuring FileZilla, you will download an XML file and import it to your FileZilla client. To configure the FileZilla FTP client:

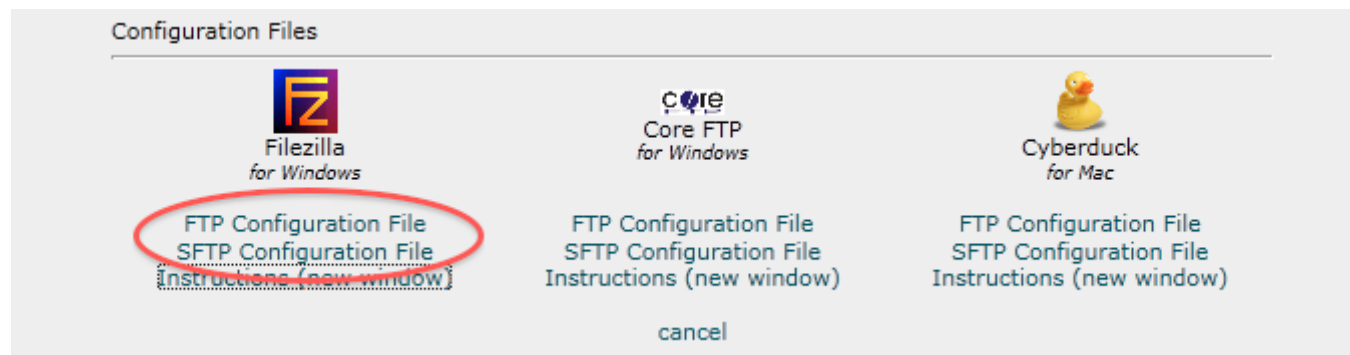

1 Step One

Click the *Configure FTP Client* link that corresponds to the FTP account you wish to use to connect to your FTP server.

2 Step Two

Click the FTP or SFTP link to download the XML file. We recommend that you use SFTP whenever possible, as it is generally more secure than FTP. Note: This step will over-write any previous XML configuration file without warning.

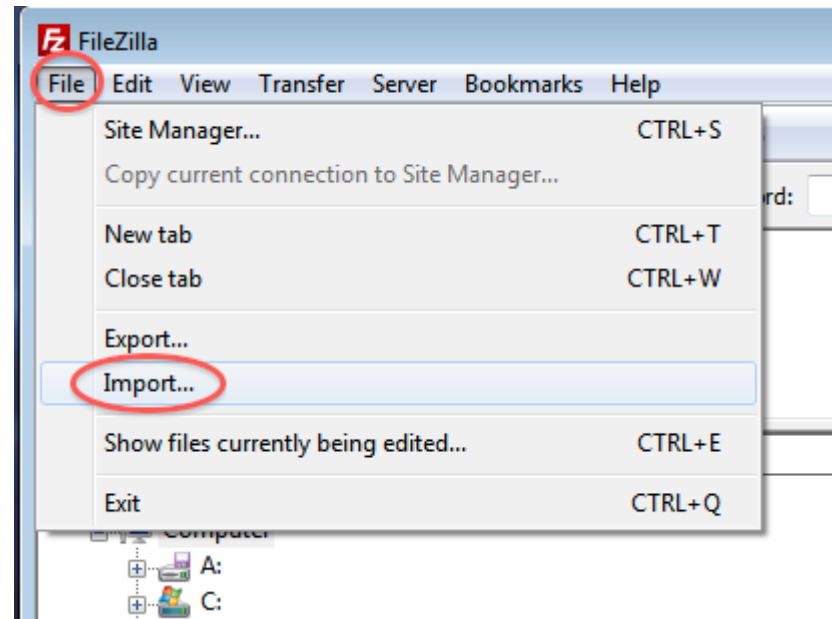

3 Step Three

Open your FileZilla FTP client.

4 **Step Four**

Select the *Import* option from the *File* menu (File → Import).

5 **Step Five**

Select the XML file you have just downloaded and click *OK*.

6 **Step Six**

Click the *OK* button on the resulting *Import Settings* window.

7 **Step Seven**

Click *OK* on the resulting *Import Successful* window.

8 **Step Eight**

To open a connection to your FTP server, select the *Site Manager* feature from the *File* menu (File → Site Manager).

9 **Step Nine**

Select your domain from the *Select Entry* menu.

10 **Step Ten**

Click the *Connect* button to connect to your FTP server.

Note: Third party products are subject to change due to circumstances beyond cPanel's control, potentially rendering these instructions invalid. If this occurs, you can always consult the product manual for the correct procedure.
